Quick fixes and how to reach us

What the Calm button is

The Calm button puts your child's own clinician-designed strategies one tap away, right when things are getting hard — not buried in a document you can't find in the moment.

It lives as the fourth item in your bottom navigation, always in the same place. It has exactly two states:

Warm colour, taps straight through Grey, with a small padlock

The button unlocks automatically once two things are both true: your child's Functional Behaviour Assessment (FBA) is complete, and your clinician has published at least one Calm Card from it. Until then, tapping the locked button opens a short explanation instead of the flow itself.

Tapping the locked button explains exactly what's still needed to unlock it

● NOTHING TO SET UP

You don't request or activate the Calm button yourself — it simply appears live the moment your clinician has it ready. There's no separate step on your side.

Using it, in the moment

Tap the Calm button and you're asked one simple question: what's going on right now?

Two doors — pick whichever matches the moment

There's no wrong answer here. Pick "It's happening now" if things are already at their hardest, or "Something's building" if you can see it coming. Either door takes you somewhere useful.

Narrowing it down (optional)

If your clinician has tagged cards with specific triggers, you'll see a quick, optional screen of tags — noise, transitions, whatever fits. Tap what applies, or skip it entirely with "Not sure."

Entirely optional — it just helps surface the most relevant card first

The cards themselves

Each card is short and concrete — usually two or three plain steps, written by your clinician specifically for your child. Swipe to move between cards; the dots at the bottom show where you are.

A Calm Card mid-carousel

The safety line

Every card has a quiet link at the bottom: "None of this helping?" It's always there, on every card, and it's never triggered by accident — no swipe or gesture can reach it, only a deliberate tap.

Emergency numbers, front and centre — no other prompts on this screen

This screen exists for the moments a card genuinely isn't enough. It shows nothing else — no logging prompt, no rating ask — just the numbers that matter, immediately.

After you leave

Leaving normally (not through the safety line) asks one quick, optional question about the last card you looked at.

One tap, no confirmation screen — you're straight through to the next step

● WHY WE ASK

Your answer helps your clinician see which strategies are actually working day to day, at home and at school — not just on paper. It's signal, not a test, and it's always skippable. This never appears on the safety line, no matter what.

Logging what happened

Right after, you're gently asked whether it's worth logging the incident properly — useful for spotting patterns over time, but entirely optional.

"Not now" is always right there, no less prominent than "Log it"

Choose "Not now" and you'll find a gentle reminder waiting on your home screen next time you open the app — nothing pushy, just there if you want it.

A quiet reminder card, dismissible whenever you're ready

Setting it up, for clinicians

Calm Cards are authored inside the FBA workspace, in the same Recommendations section as your written strategies — each card is tied to a specific recommendation, home, school, or shared.

Home

1. Visual transition timer

- Show the 5-minute visual timer before ending a preferred activity.
- Pair with a calm verbal countdown at the 2-minute and 1-minute marks.

Strategy type

Transition warning

Calm Card - Published

[Unpublish](#)[Add Calm Card](#)

2. Offer two calm-down choices

- When Alfie is getting overwhelmed, offer two concrete choices: quiet corner or headphones.
- Avoid open-ended 'what do you need?' in the moment -- too much to process while dysregulated.

Strategy type

Choice-making

[Add Calm Card](#)

3. Morning visual schedule

- Use the laminated morning schedule card at breakfast.
- Let Alfie tick off each step himself as he completes it.

Strategy type

No strategy type

Calm Card - Draft

[Publish](#)[Add Calm Card](#)

School

1. Give a 2-minute transition warning

- Before ending an activity, give a spoken 2-minute warning plus the visual timer.
- Avoid surprise transitions during PE and art -- these are his hardest transitions.

Strategy type

Transition warning

[Add Calm Card](#)

2. Offer a sensory break card

- Alfie can show his break card to request 5 minutes in the quiet corner without asking verbally.

Strategy type

Sensory/movement break

Calm Card - Published

[Unpublish](#)[Add Calm Card](#)

Shared

1. Calm, low tone during distress

- Speak clearly, one short sentence at a time.

• Speak slowly, one short sentence at a time.
• Wait for him to respond before saying anything else.

Strategy type

Calm adult response ▼

✎ Add Calm Card

Every strategy entry can carry its own Calm Card — published, draft, or none yet

Any recommendation without a card yet shows a simple "+ Add Calm Card" — including on an already-locked, finalised FBA. Adding or editing a card's content is metadata, not a change to the assessment itself, so it stays available even after finalisation.

- 1 **Write two or three short steps.** Plain, concrete language — this is what a parent reads mid-crisis, not clinical shorthand.
- 2 **Choose a door.** "Something's building" for prevention, "It's happening now" for de-escalation.
- 3 **Tag it, optionally.** Trigger tags help the parent-facing narrowing screen surface the right card faster.
- 4 **Publish when ready.** A card sits as a private draft until you publish it — nothing reaches a parent before you're satisfied with it.

The Calm button only goes live for a family once the FBA is **completed** and at least one card is **published**. Drafts are invisible to parents, however many you have.

Checking it's live

The child's Clinical File carries a small tag right under their name whenever the button is genuinely live for that family.

"Calm button live" — a quick, always-visible confirmation

The red notice

If a parent ever taps the safety line, it's not silent on your end. A high-visibility red notice appears on your dashboard immediately, and stays there — no auto-dismiss, no timeout — until you acknowledge it.

Persists until you tap Acknowledge — this is deliberately not something that can be missed

Tap "View case" to go straight to that child's Clinical File, or "Acknowledge" once you've made contact. This is a genuine emergency-support signal, separate from ordinary clinical review — please treat it accordingly.

Help & Support

A few common questions about the Calm button specifically.

The Calm button still shows locked, but I know the FBA is finished.

Both conditions have to be true — a completed FBA, and at least one *published* Calm Card. Check with your clinician that they've published at least one card, not just saved it as a draft.

I tapped a card by accident while scrolling — did that count as anything?

No. Viewing a card never records anything on its own. Only leaving normally (which offers the optional rating) or the deliberate safety-line tap create any record.

As a clinician, can I still edit a Calm Card after the FBA is locked?

Yes — the strategy type tag and the card itself are both editable post-hoc, on a locked FBA, exactly as described in Chapter 4. The assessment content itself stays locked; the Calm Card is treated as a companion layer.

Does viewing a Calm Card notify the clinician?

No — only the safety line does that, and it's genuinely urgent when it fires. Ordinary use of the Calm button is private to the family, aside from the optional, anonymous-feeling rating.

Still stuck?
