Contents

1 What Progress shows

And why it takes a few days of logging first

2 Reading it as a parent

The mosaic, the trends graph, and streaks

3 If there isn't much data yet

An honest, unlocking view — not a broken one

4 What a teacher sees

The same picture, scoped to school

5 The clinician's fuller view

Custom ranges and the function breakdown

6 Help & Support

Quick fixes and how to reach us

What Progress shows

Every morning check-in and every end-of-day update quietly builds a picture over time — Progress is where that picture becomes visible, instead of scattered across individual days you'd have to remember.

You'll find it from the More menu, under your child's name.

One tap from More takes you straight there

● TRENDS UNLOCK AS YOU LOG

A single good or hard day doesn't tell you much on its own. The trends graph only draws a confident line once there's enough real logging behind it — usually a handful of days within the period you're looking at. Until then, you'll see an honest "early signal" note instead of a line that would be more guess than pattern.

Reading it as a parent

Progress is built from a few simple pieces, stacked top to bottom.

The week at a glance

A row of coloured squares, one per day — the top half is the morning check-in, the bottom half is school's afternoon update. A small dashed square marks any day a new strategy was added to the passport, so you can see whether things shifted around that point.

The trends graph

Underneath, the same information becomes a line graph you can actually read trends from — with three series you can turn on or off: Incidents, Morning regulation, and School regulation.

"By weekday" — useful for spotting a pattern like "Mondays are always hard"

Streaks

Two small counters track your current run — settled days in a row, and check-ins in a row — alongside your best-ever streak of each. A gentle nudge, never a scoreboard.

If there isn't much data yet

A brand new passport, or a quiet week of logging, doesn't produce a broken-looking page — it produces an honest one.

Empty mosaic cells, a straightforward "building the picture" note, and no fabricated trend line

Every message here tells you exactly what's missing and roughly how much more logging unlocks the next level of detail — a period comparison, a confident trend line, and so on. Nothing is ever presented as a confident pattern on too little data.

What a teacher sees

The same Progress view sits inside a pupil's classroom profile, under its own tab — built from exactly the same morning check-ins, end-of-day updates, and incident logs, so home and school are always reading the same picture.

+ Log ABC Incident

A teacher's view of one pupil's Progress, inside their Classroom Profile

A teacher's view is scoped to what they're already able to see elsewhere in the app — nothing from the child's clinical file leaks in through Progress that isn't already visible on the passport itself.

The clinician's fuller view

Clinicians see everything a parent and teacher do, plus two things unique to case review: a genuinely custom date range, and a breakdown of hypothesised behavioural function over time.

What's happening around incidents

Before Behaviour After

Transition to new activity 75% (6)
Too loud or busy 13% (1)
Sensory overload 13% (1)

A custom "From / To" range, alongside the clinician-only function breakdown further down the page

The function breakdown reads tagged ABC incidents from the period in view and shows the proportion attributed to each hypothesised function — escape, attention, tangible, sensory, and so on. Untagged incidents are deliberately excluded from this count rather than guessed at, and the page says so plainly.

Everything here is still **unvarnished, never softened** for the clinician lens — a hard week reads as a hard week, with no tone-management layered on top the way it is for parents and teachers elsewhere in the app.

Help & Support

A few common questions about Progress specifically.

Why does the trends graph show a gap on some days?

A gap simply means no check-in or update was logged that day — the line deliberately breaks rather than joining across missing days, so it never implies data that isn't there.

I turned a series off by mistake — how do I get it back?

Tap the same chip again. Nothing is deleted; the toggle only changes what's currently drawn on the graph.

Why can't I set a custom date range as a parent?

The preset ranges (7/30/90 days, all time) cover what a parent or teacher typically needs day to day. A genuinely custom range is a clinician case-review tool, available on the clinician lens only.

The strategies-added marker is on the graph but I don't remember a new strategy.

It marks the date a clinician's approved recommendation was added to the passport — worth checking the "From your Clinical Team" section of the passport for what changed around that date.
